

# Flutter Developer Assessment TaskFlutter Developer Assessment Task

## The Task: Inventory & Stock Manager

**Context:** A small shop owner needs a simple app to manage inventory track stock, log sales, and get alerted when items are running low. Their internet connectivity is unreliable, so the app needs to work offline and sync when back online.

### Core requirements:

- Add / edit / remove products (name, quantity, price)
- Log a sale (deducts stock accordingly)
- Low-stock alert (you decide the threshold logic)
- App must work fully offline, and sync when connectivity returns
- Basic list/detail UI — functional and usable, polish level is your call

**What's intentionally left open:** We haven't specified state management approach, local storage, sync/conflict resolution strategy, or exact UI depth. That's by design we want to see how you approach a real, underspecified product ask, not just follow a spec.

## What to Include

Along with the working app, please add a short README covering:

1. What you built, and what you deliberately left out and why
2. How you handled offline support and sync/conflict resolution
3. If you had 2 more days, what would you add or improve next?

We're as interested in your reasoning and trade-offs as we are in the code itself feel free to be candid in the README about shortcuts you took given the time box.

Looking forward to seeing what you build!
